Apprenticeships are key to solving skills shortage

A life in manufacturing is exciting to me and many others.

But successive governments have not viewed it that way – until now.

The recession has really made manufacturing more important.

What’s been recognised is if we make things in the UK, it not only reduces the amount we import but also allows us to export, making trade figures a lot better.

This week we had the Doug Richard report about apprenticeships.

But while I welcome it, it comes hot on the heels of the Jason Holt report, the Michael Heseltine review, the government White Paper, and the Small Business Report.

You can have as many surveys as you like about training – none are any good unless they are acted on.

My problem is over the years SMEs have seriously lost out to the big conglomerates when it comes down to support and funding, especially for younger people.

If the big boys want help, the politicians and training providers fall over themselves, all looking for big headlines in the newspapers and on TV and radio.

The belief by government and civil servants was that if one company was supported to the hilt their success would cascade down to the SMEs.

This has not happened.

Even now in many parts of the country there is a very serious engineering skills shortage.

I have been banging on for years that we (SMEs) need more help and encouragement in solving this problem.
